

Physical Complexity

Part A: Emergent behaviour
in physical infrastructures

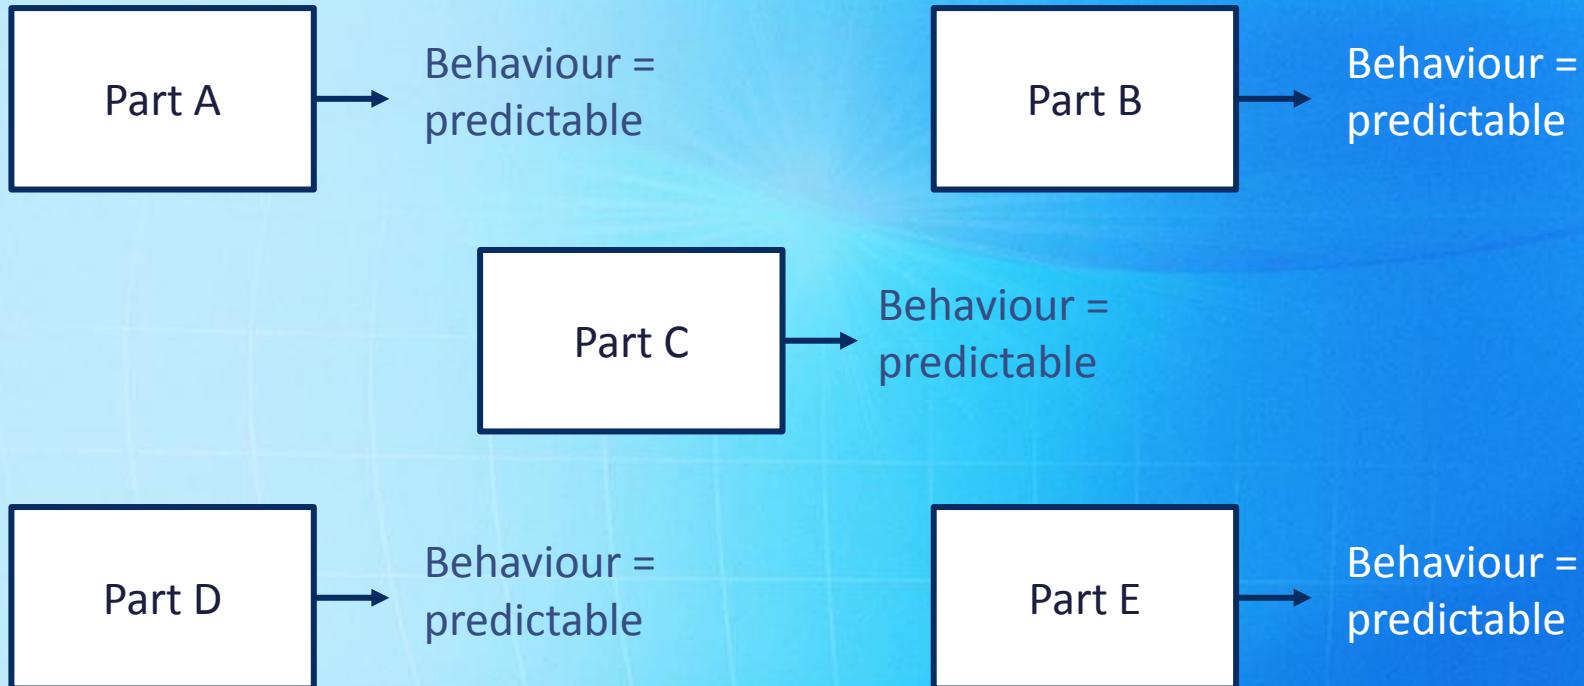

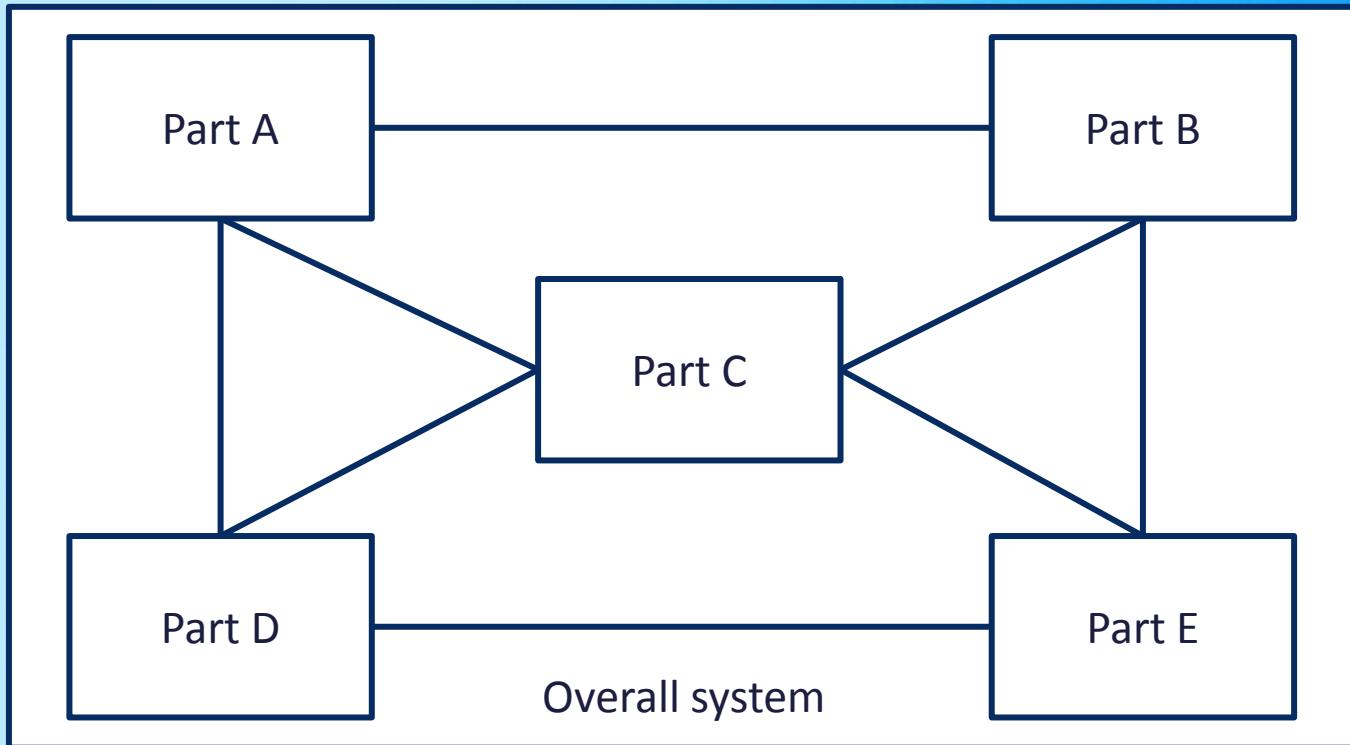

Prof.dr.ir. M.P.C. Weijnen

Professor, Faculty of TPM, TU Delft

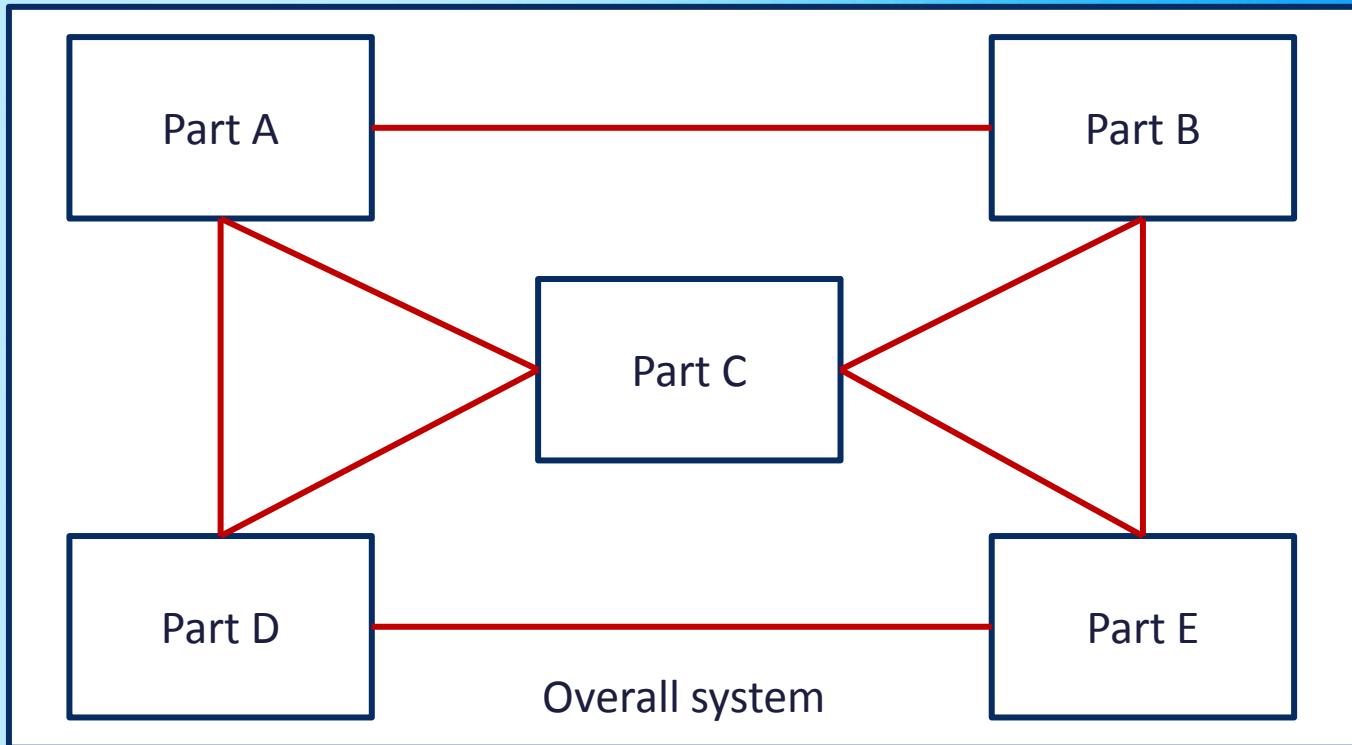

Emergent behaviour

- Behaviour at the macro-level emerges from the behaviour of system elements at the micro-level.
- Often unpredictable

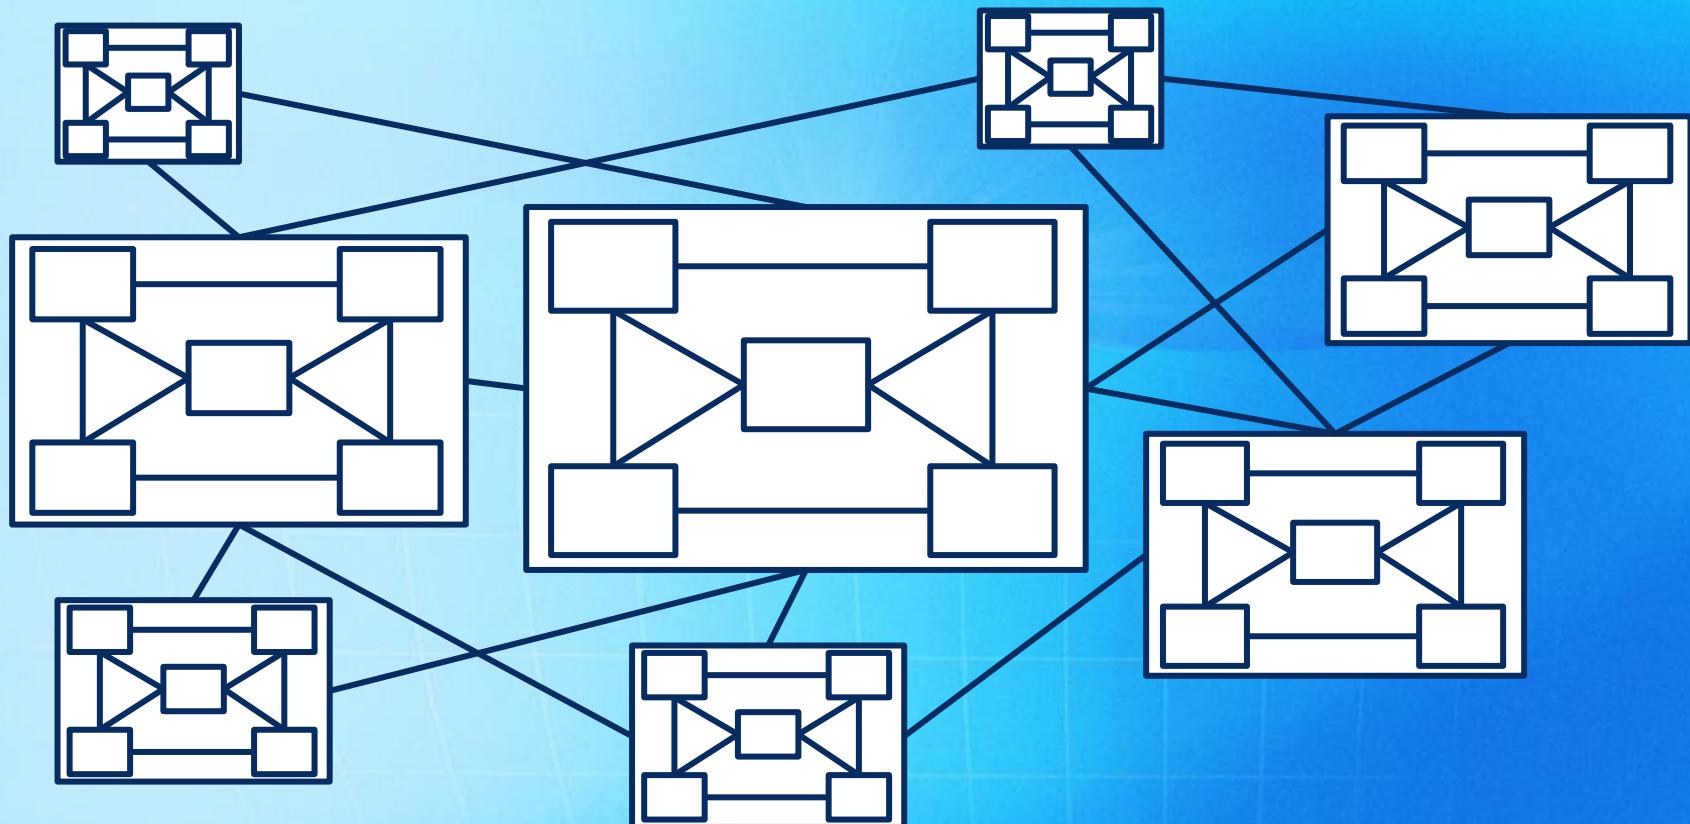

Behaviour can
be
unpredictable!

Complexity is in
the **interactions**

Emergence is everywhere

Emergence is everywhere

A close-up photograph of a large, dense cluster of bees, likely a swarm, clinging to a dark, textured surface, possibly a tree branch. The bees are oriented in various directions, some facing the camera and others away. Their bodies are a mix of dark brown and golden-yellow, with distinct black and yellow stripes on their abdomens. The background is blurred, showing hints of green foliage and sunlight filtering through leaves.

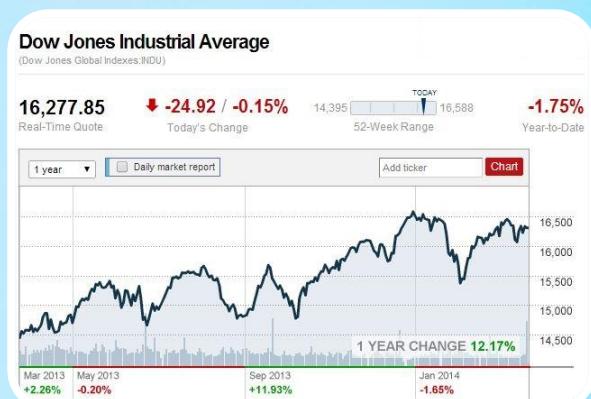

Emergence is everywhere

Legacy Infrastructures

- Are a patchwork of local, regional and national networks
- Were subject to national standards

Legacy infrastructures

- Are a patchwork of old and new technologies

Ageing infrastructures

- Yorkshire water: 40 % loss due to leaking pipelines, 1990's
- Asset life cycle management standards

Changing functionality

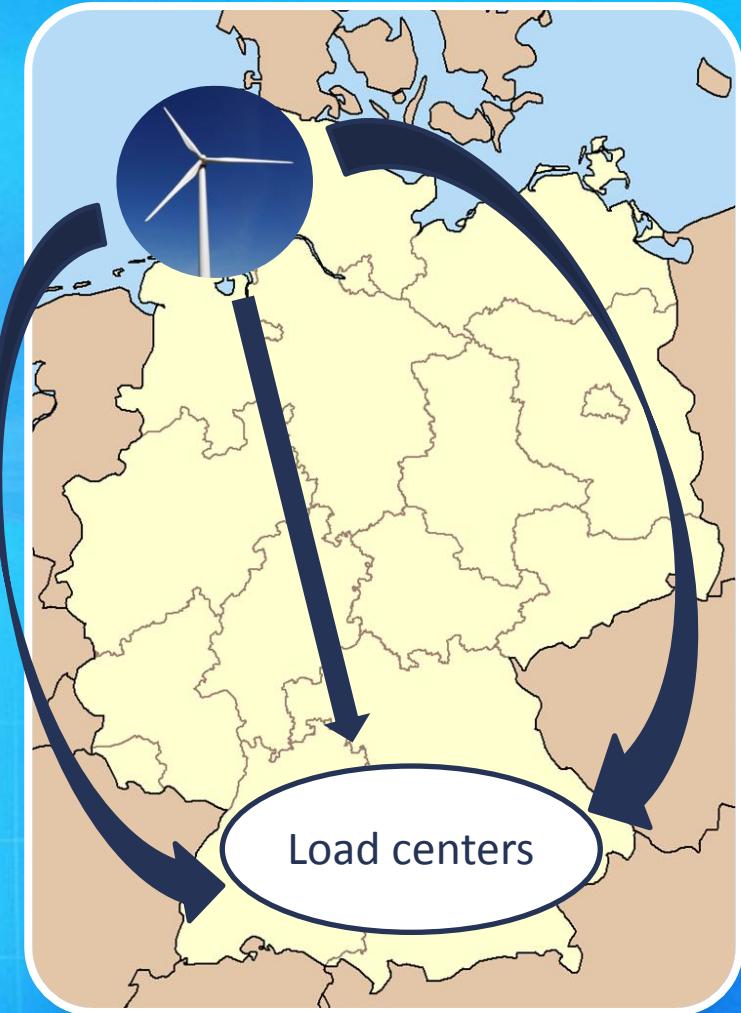

- Cross-border interconnectors
- From back-up facility to accommodating international electricity trading

Changing functionality

- The nature of electric power generation is changing
- More and more electricity generated from renewable sources

Germany

- Wind parks in the northern part
- Load centers in the southern part
- A lack of interconnection capacity between the northern and the southern part
- Electricity flows via neighbouring countries

Flow pattern is changing

- More wind power
- More solar power
- Higher risk of instability

Electricity infrastructures

- Little storage capacity
- Hydropower reservoirs

Electricity infrastructures

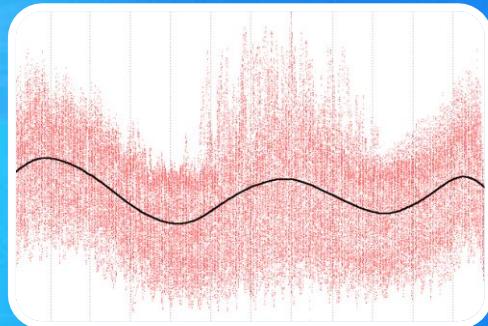

- Little storage capacity
- Hydropower reservoirs

Electricity infrastructures

- High velocity of electricity flows
- Balancing of supply and demand in real time

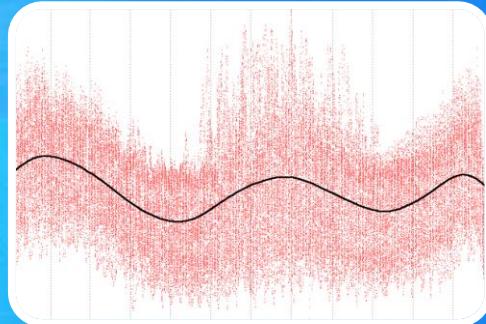

Balancing supply and demand

Supply

Demand

Balancing supply and demand

More challenging!

Physical Complexity

Part B: Drivers of infrastructure development

Prof.dr.ir. M.P.C. Weijnen

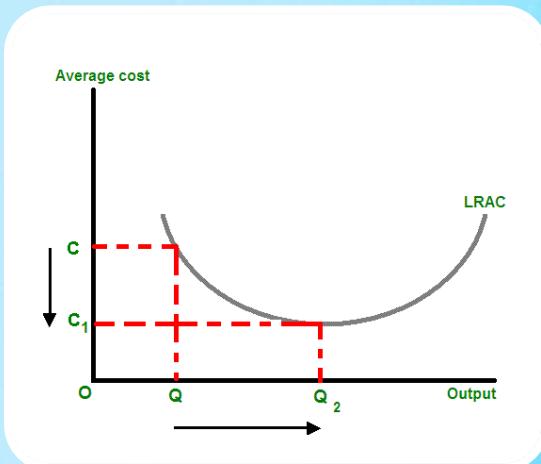

Professor, Faculty of TPM, TU Delft

Predictability

- **Small system:** possible to predict
- Tendency to grow because of:
 - Economies of scale
 - Network externalities
- **Large system:** almost impossible to predict behaviour

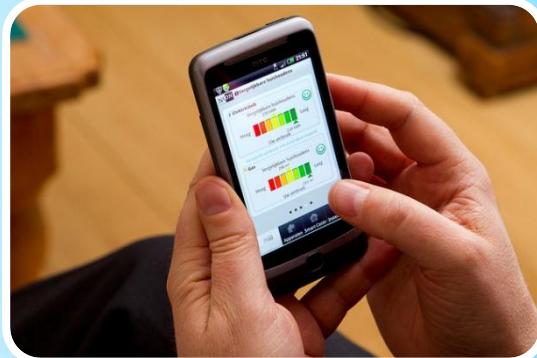

Economies of scale

- Decreasing cost per unit of output with increasing scale

Network externalities

- The more users, the more value for each user

Interdependencies

- Infrastructures have a tendency to grow into huge systems
- Subsystem failure may cause overall system failure
- Interdependencies can have various forms, e.g.:
 - Linear
 - Non-synchronous

Interdependencies

- More subsystems
- More (diverse) interrelationships
- More feedback loops
- Difficult to recognize and model

Patterns of emergent behaviour

- Patterns in aggregated behaviour of infra-systems
- Recognizing patterns is crucial for operators
- Operators use models to predict the implications of their actions

Path dependency

- Infrastructures: capital intensive

Huge sunk costs
(costs that cannot be recovered)

Sunk costs in networks

- Netherlands: 37,350 km²
- Hundreds of thousands km of cables and pipelines
- Almost 10,000 km of overhead lines
- High sunk costs → path dependency

New technologies

- Can be adopted if competitive
- For example: Mobile telephony:
 - Relatively small network investments
 - Flexibility
 - New services

Mobile telephony in emerging countries

Concept of agents

- Interacting elements
- Agent = decision making entity

Rules

...
...
...

Definition of infrastructure

- Not only physical network
- An infrastructure includes:
 - *Transport and distribution network*
 - *Carriers*
 - *Conversion and storage facilities*
 - *Governance, management and control systems*
- Actors are part of system →
Social complexity
